

Summarize the characteristics of digital libraries

Digital Libraries

2018112801 Koh Dong-Jae

Digital libraries include digital information resources ranging from text to images, audio, and video, and reduce the need for physical space to build and maintain existing libraries.

Digital library users can be distributed anywhere in the world, and in some cases, they need to design different levels of services to meet local and remote users' needs and build their own personal libraries using facilities provided by digital libraries.

Digital libraries provide access to different types of information resources that can exist in different locations around the world, which is a critical issue in digital library development and management. Digital libraries have also brought about a paradigm shift in the use of information, even in the concept of material ownership. Compared to traditional library methods, digital library users can use the same materials at the same time.

To achieve the goal of building a truly global information infrastructure, digital libraries must be able to process information in multiple languages and use appropriate mechanisms to filter out unnecessary things.

Digital libraries are subject to the absence of physical

mediators, such as librarians, and should have appropriate mechanisms in place to support users who require different levels of IT, subject, and language skills. Therefore, digital libraries should allow for better search and search facilities.

Digital information can be viewed and used by a variety of people according to their individual needs. Digital libraries are breaking down barriers to time, space, and language. Ideally, digital libraries should be available to users anywhere in the world in any language at any time.

We have looked into the characteristics of digital libraries so far, and I hope that we can make good use of digital libraries that will expand further in the future.
